

Freelancing

1. What to offer (package it clearly)

Don't say "I build websites." Say specific packages:

- **Landing page / business website** — 5-7 pages, contact form, mobile responsive
- **Web app** — login, dashboard, database (your Flask/full-stack skills fit here)
- **Mobile app** — if you can do React Native/Flutter, else skip or partner

Have 3 tiers ready: Basic / Standard / Premium with price + timeline. Clients trust structure.

2. Build proof before selling

- Put 2-3 solid projects on your portfolio site (you already have tnesh833-eng.github.io — polish it)
- Live demo links > screenshots
- One case study: "Built X for Y, result Z" (even a personal project counts if framed well)

3. Where to find clients

- **Upwork / Fiverr** — start cheap (₹3k-8k range) to get first 3-5 reviews, then raise price
- **LinkedIn** — post your work, comment on small business owners' posts, DM politely
- **Local businesses** — shops/clinics/tutors near you with no website = easy first sale
- **Cold outreach** — find businesses with bad/no website, email them directly

4. How to talk to clients (this matters most)

- **Listen first** — ask "what problem are you trying to solve" before pitching tech
- **No jargon** — say "I'll build you a page where customers can book appointments" not "I'll implement a REST API with CRUD"
- **Give options, not just yes/no** — "I can do X in 5 days for ₹Y, or X+extra feature in 8 days for ₹Z"
- **Set expectations early** — timeline, revisions included, payment terms (50% upfront is standard)
- **Follow up fast** — reply within hours, not days. This alone beats 80% of freelancers

5. Simple sales flow

1. They inquire → ask 2-3 questions about their need
2. Send a short proposal (problem → solution → price → timeline)
3. Get 50% advance → start work
4. Show progress midway (builds trust, avoids surprises)
5. Deliver → get final payment → ask for a review/referral
